Executive Summary

Rahm Sensor Development Inc. (RahmSD) is a health-technology company founded by **Vik Ramprakash**, who previously built and sold **VetGuardian®**, the first non-contact vital-sign monitor for animals, to Zomedica for approximately \$18 million.

Rahm's first product, **Cell-Guardian™**, is **FDA Class I registered** and has been **shipping through distributors since late 2025** generating a **\$1.5 million qualified pipeline across 25 counties**. It prevents self-harm and unattended deaths in correctional facilities through radar, video, audio, and AI-based monitoring with secure cloud recording.

Building on that validated foundation, Rahm is expanding into elder-care and home health with **Silver-Guardian 2.0 — an AI-enabled, voice-interactive home companion** that merges 24 GHz radar, thermal imaging, and visible-light video sensing with conversational AI. The system detects falls, tracks respiration, maintains two-way conversation, and connects seniors to telemedicine — all processed locally for privacy.

Field studies through **NSF I-Corps** and the **University of Florida GatorNest Program** confirmed **84 percent purchase intent** among caregivers and potential **labor savings of \$30 K to \$50 K per quarter per facility**.

The **U.S. aging-in-place market exceeds \$20 billion** and is growing more than 15% annually. Silver-Guardian 2.0 enters **pre-commercial pilots in Q1 2026** with **retail launch planned for H2 2026**.

With proven IP, existing revenue, and a repeat founder, **Rahm bridges AI, healthcare, and consumer trust — positioning itself among the most investable early-stage health-tech ventures.**

Company and Leadership

Founded in 2023, Rahm's mission is to deliver **presence, safety, and connection** through intelligent, privacy-aware sensors that eliminate wearables while keeping people visible, heard, and cared for.

The leadership team blends deep-tech and medical-device experience: Vivek Puthezath leads the Silver-Guardian platform, Dave Holden oversees AI and signal processing, Neil Euliano directs

Rahm Sensor
Development

embedded hardware, and Zomedica serves as Rahm's FDA-registered manufacturing partner in Atlanta. Headquartered in Orlando with engineering in Northeast Ohio, Rahm has already proven its regulatory and production capabilities through Cell-Guardian™, laying the groundwork for Silver-Guardian's expansion.

Market Context

Older adults face two interconnected risks: **falls and social isolation**, both major drivers of hospitalization, cognitive decline, and rising care costs.

In 2024, more than 61 million Americans were 65 or older; one in four experienced a fall each year, totaling roughly 36 million incidents. Loneliness increases dementia risk by 30–50 percent, and more than 22 percent of rural residents lack broadband access that enables reliable tele-care. Roughly 16 million seniors live alone — a multi-billion-dollar underserved population.

Silver-Guardian 2.0 directly addresses these issues by combining non-contact fall detection, conversational presence, and telemedicine access in a single, privacy-preserving device. This market—valued at more than \$20 billion and growing 15% annually—represents one of the fastest-expanding segments of digital health and home AI.

The Silver-Guardian Platform

Silver-Guardian unifies radar, video, and voice intelligence into a compact, always-on home companion. It detects motion, respiration, heart rate, and falls through 24 GHz continuous-wave radar, interprets behavior with on-device AI, and maintains two-way voice presence that keeps seniors engaged while reassuring families. All processing occurs locally, ensuring full privacy and independence from the cloud.

A professional version, **Silver-Guardian Pro**, adds telemedicine connectivity, vital-sign relay, and EMR integration. Both models share about 90 percent of their hardware stack, allowing scale without complexity.

Technology and Intellectual Property

Rahm's platform integrates three proprietary layers:

1. Non-contact radar for continuous motion, heart-rate, and respiration tracking.
2. AI-based behavioral inference using CLIP and related vision models.
3. Voice-presence middleware enabling real-time, cloud-free interaction.

Edge inference achieves sub-second latency while maintaining HIPAA compliance. The company holds **13 issued and 2 pending patents**, plus exclusive licenses from the **University of Florida** and **Texas Tech University**, covering radar-based vital-sign monitoring and sensor-fusion algorithms. Together, these create a defensible moat across both hardware and AI signal interpretation.

Regulatory and Manufacturing Readiness

Rahm's **FDA Class I registration** for Silver-Guardian 1.0 validated IEC 60601 safety and Zomedica's quality-management system, establishing a direct path to **Class II 510(K)** clearance for Silver-Guardian Pro. Manufacturing occurs at Zomedica's ISO 13485-compliant facility in Atlanta for PCB assembly and QA, while Rahm retains firmware and AI development in Florida and Ohio. This asset-light model keeps lead times under six weeks and capital requirements low.

Product Line and Pricing

Silver-Guardian 2.0 (Class I) retails for \$599 and provides AI-driven companionship and fall detection for independent living.

Silver-Guardian Pro (Class II) retails for \$749 and adds telemedicine and vitals-relay capabilities.

Both share hardware and software licensing that yield 25–50 percent gross margins before SaaS revenue. Each device includes a 12-month service plan with optional \$29 per-month renewal, and a Costco-style financing model (0 percent for 18 months) that positions Silver-Guardian as affordable yet premium.

Market Validation

Through NSF I-Corps and University of Florida field studies (2024), Rahm conducted more than 100 structured interviews with caregivers, administrators, and tele-health coordinators. Results showed **84 percent purchase intent** when privacy and engagement were combined, and administrators projected **\$30K to \$50K quarterly labor-efficiency savings** per facility from fewer false alarms and fall incidents. These findings confirm that buyers value connection and peace of mind over raw data—precisely what Silver-Guardian delivers.

Go-to-Market Strategy

Rahm will follow a three-phase rollout: paid pilots in memory- and assisted-living facilities to refine AI workflows; direct enterprise sales to senior-care operators; and retail introduction through **Costco roadshows** targeting adult children purchasing for parents. Customer support and setup are centralized through 1-844-4SILVRG and the Silver-Guardian app. This measured expansion ensures validation and channel learning before national scale.

Financial Overview

Hardware margins scale from 25 to 50 percent as production grows from 350 to 10,000 units. At 5,000 units, COGS is expected near \$500; at 10,000, around \$340. SaaS adoption (~40 percent attach rate at \$29 per month) lifts blended margins toward 45 percent, with recurring revenue exceeding 60 percent of margin mix by 2027. Based on Cell-Guardian data, customer-acquisition payback occurs within six months and LTV/CAC ratios reach 3× at scale. Breakeven arrives near 8,000 annual units, yielding projected revenues of \$2.8 million in 2026, \$8 million in 2027, and \$25 million in 2028.

Competitive Landscape

Current solutions—CarePredict, SafelyYou, Alexa Together, Life Alert—solve narrow sub-problems through wearables, cameras, or reactive alerts, often raising adherence and privacy concerns. Rahm differentiates by combining non-contact radar, voice AI, video context, and FDA-level trust in a privacy-preserving design. This hybrid of medical rigor and consumer usability establishes Rahm as the bridge between smart-home devices and regulated healthcare.

Figure 3: Rahm's ability to show privacy enablement in place

Funding and Use of Proceeds

Rahm is raising **\$2 million Seed-2** via SAFE (25 percent discount) to extend 18 months to Series A. Proceeds will fund hardware cost-down and AI integration (40 percent), pilot and retail expansion (35 percent), regulatory 510(K) and compliance (15 percent), and working capital (10 percent). This financing will deliver Class II clearance, Costco launch readiness, and >\$500K ARR milestone. Strategic co-investment discussions are underway with health-tech funds and Zomedica-aligned partners.

Investment Thesis and Outlook

Rahm offers rare execution credibility in a high-growth market. The aging-in-place sector, expanding more than 15% annually, lacks entrants that combine FDA compliance, AI presence, and real revenue. Rahm's dual-SKU model balances consumer volume and clinical margin while building a long-term data moat around behavioral health.

With an \$18 million founder exit, active revenues, and FDA-cleared technology, Rahm is Series-A-ready by mid-2027. Potential acquirers include Teladoc, Philips, and Amazon Care, implying an exit valuation between \$150 and \$250 million post-Class II approval.

The Future of Guardian Intelligence

Rahm's long-term vision extends beyond monitoring into *preserving presence*—creating a living bridge between memory, emotion, and technology. Future Guardian systems could learn each individual's tone, cadence, and warmth, transforming daily interactions into a lasting voice of comfort and continuity. With consent and ethical design at the core, this evolution enables families to maintain meaningful connection across distance, decline, and time.

This is not imitation but continuity: a new class of empathetic AI that keeps loved ones seen, heard, and remembered while safeguarding privacy and dignity. By fusing radar, voice, and emotional intelligence, Rahm is poised to own the next category in human-centric AI — an intelligence that lives with you, learns from you, and carries your care forward.

Legacy and Immortality

If a grandmother tells her life story through Silver-Guardian, her legacy can become a living narrative — a voice that endures. An old Romani proverb says, ***"You only die when the last person who remembers you dies."*** Guardian Intelligence moves us closer to defying that truth, not through imitation but remembrance. Every laugh, lesson, and conversation becomes part of a living chronicle — a form of digital immortality grounded in love and consent.

**Rahm Sensor
Development**

This is the emotional core of Rahm's mission: to make human presence enduring. When technology can keep a person felt, not merely remembered, we don't just extend lifespan — we extend legacy. That is the billion-dollar opportunity: building the world's first trusted AI presence platform where technology does not replace life; it preserves it.
